

DataReady for WebWizard

Does the end user need simple ad-hoc reporting software at your institution? Reports aren't about getting fancy, complicated software on someone's PC. Today, information has to be real-time, mobile, easy to use. For the end user, that means using any browser, cell-phone or Palm Pilot to get to your Datatel files. For the system administrator, that could mean using the dictionaries and data definitions already found in the UniData database; you aren't forced to manipulate, isolate, reconcile, or export data to any remote or duplicate databases. Using **DataReady for WebWizard**, you can use the UniData database as a powerful warehousing tool without any new database issues, maintenance or costs.

View reports online. Share your reports with other faculty or staff. In fact, even students and alumni can use **DataReady for WebWizard**. Email data directly or just the links to the reports. Validate user identification for secure reports. Do you prefer loading numbers directly into Microsoft Excel? Easily done.

We help you break your reports up into three simple steps. First, pick the data you want to see. Next, pick the columns you want on your output. Because these two steps are distinct, you can use different lists with different report formats; you can mix and match any of your lists with any of your columns. Finally, just run the report. Any of these steps can be saved for future use or even shared with other people. No system administrator had to be involved. For example, the manager for admissions recruiting can share lists of students with her staff but let each recruiter run their own custom reports.

You'll be amazed by the simplicity of its design. You control what each specific individual sees. **DataReady for WebWizard** now even lets you take screen snapshots and use those pictures to pick which fields to use in the report. You can also limit individuals to only report the items that they have access to see. If faculty or staff in Physics is prevented from seeing data from the Biology department, **DataReady for WebWizard** uses the existing security definitions to prevent unauthorized access. Ease of use for the power user.

Best of all, it's **WebWizard** middleware that integrates **DataReady** to your UniData database. With **WebWizard**, you can go beyond reporting and develop sophisticated browser-based applications. Just ask any of our customers or check out the Datatel listserv; you'll discover some the magic they've been able to do with **WebWizard**.

DataReady for WebWizard supports

- Existing IBM U2 UDMS /UniData Database File Systems
- Off-the-shelf HTML Designers, graphics, frames, and maps for your own custom look and feel
- Datatel's software and databases
- 3rd party vendor databases

DataReady for WebWizard can

- Deliver real-time reports where the user selects the list criteria and the output format
- Output to Microsoft Excel, E-mail, static files, standard report files — you name it!
- Let users share reports with other users
- Allow the Administrators to audit trail report access
- Produce standardized form letters
- Eliminate the need for flattened, extracted databases
- Generate bulk emails
- Be enhanced easily if you know UniData Basic
- Be maintained by just altering a file's dictionary
- Can restrict access to just a few dictionary items

The easiest reporting tool for the power user

DataReady for WebWizard is secure —

- SSL support
- Encrypted communications
- Login routines can be customized to meet your specific WebAdvisor or portal system
- Field-level security based on existing Datatel security mechanisms

DataReady for WebWizard simply does *not* require

- any applets or components to run on the browser or PC
- any specific browser or a certain release level of any browsers
- prior knowledge of HTML, ODBC, or SQL programming
- Envision or any other 4-GL tools to write software
- painful flattening of files for extraction to another database

DataReady for WebWizard does require

- UniData release 3.0 or above
- A web server that runs on Windows, UNIX or Linux
- An ability to securely communicate between the web server and the database server
- An understanding of who should have access to which data files and fields

DataReady for WebWizard will be even more powerful if

- You understand how Datatel databases are structured
- You integrate it with interactive devices, such as Palm Pilots and cell-phones, for true mobility
- You use it to quickly and easily share data for use in spreadsheets
